## Amendments to the Claims:

No amendments are made to the claims. All pending claims are listed below.

- 1. (Previously Amended) A method for computing a diversity measure for a group of web pages, C, having n elements, wherein the diversity measure indicates a level of diversity for the group of web pages, the method comprising steps of:
- (a) identifying M substructures c<sub>1</sub> through c<sub>M</sub> each having m elements from among the n elements of the group of web pages C, where M equals n! / [(n-m)! m!];
- (b) for each substructure  $c_i$ , for i from 1 to M, determining a number  $n_i$  of the M substructures  $c_1$  through  $c_M$  that are similar to the substructure  $c_i$ ; and
- (c) computing a first entropy Φ(m) based upon all the numbers n<sub>i</sub> computed during step (b) and based
   upon M in computed step (a);
- 2. (Original) A method as in claim 1, further comprising the steps of:
- (d) repeating steps (a) and (b) with m+1 substituted for m;
- (c) computing a second entropy  $\Phi(m+1)$  based upon all the numbers  $n_i$  and M computed during step (d); and
- (f) subtracting the second entropy  $\Phi(m+1)$  from the first entropy  $\Phi(m)$  to produce the diversity measure.
- (Original) A method as in claim 2, wherein steps (c) and (e) comprise the steps of:
   for each i from 1 to M:

computing a fraction F<sub>i</sub> by dividing n<sub>i</sub> by M; and computing a logarithm of fraction F<sub>i</sub>;

computing a sum by adding all logarithms of fractions  $F_i$  for i from 1 to M; and dividing the sum by M.

4. (Original) A method as in claim 2, wherein step (b) comprises the steps of, for each substructure c<sub>i</sub> for i from 1 to M:

for each substructure c<sub>i</sub> for j from 1 to M:

computing a distance function  $d(c_i,c_j)$  representing a measure of a difference between substructure  $c_i$  and substructure  $c_j$ ;

comparing the distance function  $d(c_i,c_j)$  to a threshold; and determining the substructures  $c_i$  and  $c_j$  to be similar if and only if the distance function  $d(c_i,c_j)$  is less than the threshold.

6. (Original) A method as in claim 2, wherein steps (c) and (e) comprise the steps of:
for each distinct substructure c<sub>i</sub>:

computing a frequency  $f_i$  by dividing  $n_i$  by M; computing a logarithm of frequency  $f_i$ ; and computing a product by multiplying the frequency  $f_i$  and the logarithm of frequency  $f_i$ ; and

computing a sum by adding all products of the frequencies  $\mathbf{f}_i$  and the logarithms of frequencies  $\mathbf{f}_i$ .

6. (Original) A method as in claim 2, wherein step (b) comprises the steps of: for each substructure  $c_i$  for i from 1 to M:

monotonically renumbering in elements of  $c_i$  from 1 to m; and for each substructure  $c_i$  for j from 1 to M:

- 3 -

monotonically renumbering m elements of  $c_j$  from 1 to m; and determining the substructures  $c_i$  and  $c_j$  to be similar if and only if they are identical.

7. (Original) A method as in claim 2, wherein step (b) comprises the steps of:

for each substructure ci for i from 1 to M:

monotonically renumbering m elements of  $c_i$  from 1 to m; and

for each substructure c<sub>j</sub> for j from 1 to M:

monotonically renumbering m elements of ci from 1 to m; and

determining the substructures  $c_i$  and  $c_j$  to be similar if and only if they are identical or isomorphic.

8. (Original) A method as in claim 2, wherein steps (c) and (c) comprise the steps of:

for each distinct substructure ci:

computing a frequency fi by dividing ni by M;

computing a quotient by dividing the frequency fi by an expected frequency pi;

computing a logarithm of quotient qi; and

computing a product by multiplying the frequency  $f_i$  and the logarithm of quotient  $q_i$ ; and computing a sum by adding all products of the frequencies  $f_i$  and the logarithms of quotients  $q_i$ .

10. (Previously Amended) A computer readable storage medium, comprising:

FLIESLER MEYER LLP -> PTO GENERAL EAX

**2**008

Appl. No. 09/359,599

computer readable program code embodied on said computer readable storage medium, said computer

readable program code for programming a computer to perform a method for computing a diversity measure

for a group of web pages, C, having n elements, wherein the diversity measure indicates a level of diversity for

the group of web pages, the method comprising steps of:

(a) identifying M substructures c1 through cM each having in elements from among the n elements of the

group of web pages C, where M equals n! / [(n-m)! m!];

(b) for each substructure c<sub>i</sub>, for i from 1 to M, determining a number n<sub>i</sub> of the M substructures c<sub>1</sub> through

c<sub>M</sub> that are similar to the substructure c<sub>i</sub>; and

(c) computing a first entropy  $\Phi(m)$  based upon all the numbers  $n_i$  computed during step (b) and based

upon M in computed step (a);

11. (Original) A computer readable storage medium as in claim 10, the method further comprising the

steps of:

(d) repeating steps (a) and (b) with m+1 substituted for m;

(e) computing a second entropy  $\Phi(m+1)$  based upon all the numbers  $n_i$  and M computed during step (d);

and

(f) subtracting the second entropy  $\Phi(m+1)$  from the first entropy  $\Phi(m)$  to produce the diversity measure.

12. (Original) A computer readable storage medium as in claim 11, wherein steps (c) and (e) comprise

the steps of:

for each i from 1 to M:

computing a fraction Fi by dividing ni by M; and

computing a logarithm of fraction Fi;

- 5 -

computing a sum by adding all logarithms of fractions  $F_i$  for i from 1 to M; and dividing the sum by M.

13. (Original) A computer readable storage medium as in claim 11, wherein step (b) comprises the steps of, for each substructure c<sub>i</sub> for i from 1 to M:

for each substructure c<sub>i</sub> for j from 1 to M:

computing a distance function  $d(c_i,c_j)$  representing a measure of a difference between substructure  $c_i$  and substructure  $c_j$ ;

comparing the distance function  $d(c_i,c_j)$  to a threshold; and determining the substructures  $c_i$  and  $c_j$  to be similar if and only if the distance function  $d(c_i,c_j)$  is less than the threshold.

14. (Original) A computer readable storage medium as in claim 11, wherein steps (c) and (e) comprise the steps of:

for each distinct substructure ci:

computing a frequency fi by dividing ni by M;

computing a logarithm of frequency f; and

computing a product by multiplying the frequency  $f_i$  and the logarithm of frequency  $f_i$ ; and computing a sum by adding all products of the frequencies  $f_i$  and the logarithms of frequencies  $f_i$ .

15. (Original) A computer readable storage medium as in claim 11, wherein step (b) comprises the steps of:

for each substructure ci for i from 1 to M:

monotonically renumbering m elements of c; from 1 to m; and

for each substructure c<sub>i</sub> for j from 1 to M:

monotonically renumbering m elements of c<sub>i</sub> from 1 to m, and

determining the substructures ci and cj to be similar if and only if they are identical.

16. (Original) A computer readable storage medium as in claim 11, wherein step (b) comprises the steps of:

for each substructure ci for i from 1 to M:

monotonically renumbering m elements of ci from 1 to m; and

for each substructure ci for j from 1 to M:

monotonically renumbering m elements of c<sub>j</sub> from 1 to m; and

determining the substructures  $c_i$  and  $c_j$  to be similar if and only if they are identical or isomorphic.

17. (Original) A computer readable storage medium as in claim 11, wherein steps (c) and (e) comprise the steps of:

for each distinct substructure ci:

computing a frequency fi by dividing ni by M;

computing a quotient by dividing the frequency fi by an expected frequency pi;

computing a logarithm of quotient qi; and

computing a product by multiplying the frequency  $f_i$  and the logarithm of quotient  $q_i$ ; and

computing a sum by adding all products of the frequencies fi and the logarithms of quotients qi.

19. (Previously Amended) A computer system, comprising:

a processor; and

a processor readable storage medium coupled to the processor having processor readable program code embodied on said processor readable storage medium, said processor readable program code for programming the computer system to perform a method for computing a diversity measure for a group of web pages, C, having n elements, wherein the diversity measure indicates a level of diversity for the group of web pages, the method comprising steps of:

- (a) identifying M substructures  $c_1$  through  $c_M$  each having m elements from among the n elements of the group of web pages C, where M equals n! / [(n-m)! m!];
- (b) for each substructure  $c_i$ , for i from 1 to M, determining a number  $n_i$  of the M substructures  $c_1$  through  $c_M$  that are similar to the substructure  $c_i$ ; and
- (c) computing a first entropy  $\Phi(m)$  based upon all the numbers  $n_i$  computed during step (b) and based upon M in computed step (a);
- 20. (Original) A computer system as in claim 19, the method further comprising the steps of:
- (d) repeating steps (a) and (b) with m+1 substituted for m;
- (e) computing a second entropy  $\Phi(m+1)$  based upon all the numbers  $n_i$  and M computed during step (d);
- (f) subtracting the second entropy  $\Phi(m+1)$  from the first entropy  $\Phi(m)$  to produce the diversity measure.
- 21. (Original) A computer system as in claim 20, wherein steps (c) and (e) comprise the steps of:

and

for each i from 1 to M:

computing a fraction  $F_i$  by dividing  $n_i$  by M; and computing a logarithm of fraction  $F_i$ ; computing a sum by adding all logarithms of fractions  $F_i$  for i from 1 to M; and dividing the sum by M.

22. (Original) A computer system as in claim 20, wherein step (b) comprises the steps of, for each substructure c<sub>i</sub> for i from 1 to M:

for each substructure c; for j from 1 to M:

computing a distance function  $d(c_i,c_j)$  representing a measure of a difference between substructure  $c_i$  and substructure  $c_j$ ;

comparing the distance function  $d(c_i, c_j)$  to a threshold; and

determining the substructures  $c_i$  and  $c_j$  to be similar if and only if the distance function  $d(c_i,c_j)$  is less than the threshold.

23. (Original) A computer system as in claim 20, wherein steps (c) and (e) comprise the steps of:
for each distinct substructure c<sub>i</sub>:

computing a frequency fi by dividing ni by M;

computing a logarithm of frequency fi; and

computing a product by multiplying the frequency  $f_i$  and the logarithm of frequency  $f_i$ ; and computing a sum by adding all products of the frequencies  $f_i$  and the logarithms of frequencies  $f_i$ .

24. (Original) A computer system as in claim 20, wherein step (b) comprises the steps of:

for each substructure c<sub>i</sub> for i from 1 to M:

monotonically renumbering m elements of c; from 1 to m; and

for each substructure c<sub>i</sub> for j from 1 to M:

monotonically renumbering m elements of  $c_i$  from 1 to m; and determining the substructures  $c_i$  and  $c_i$  to be similar if and only if they are identical.

25. (Original) A computer system as in claim 20, wherein step (b) comprises the steps of:

for each substructure c<sub>i</sub> for i from 1 to M:

monotonically renumbering m claments of  $c_i$  from 1 to m; and for each substructure  $c_i$  for j from 1 to M:

monotonically renumbering m elements of c; from 1 to m; and

determining the substructures  $\mathbf{c}_i$  and  $\mathbf{c}_j$  to be similar if and only if they are identical or isomorphic.

26. (Original) A computer system as in claim 20, wherein steps (c) and (e) comprise the steps of: for each distinct substructure c<sub>i</sub>:

computing a frequency fi by dividing ni by M;

computing a quotient by dividing the frequency fi by an expected frequency pi;

computing a logarithm of quotient qi; and

computing a product by multiplying the frequency  $f_i$  and the logarithm of quotient  $q_i$ ; and computing a sum by adding all products of the frequencies  $f_i$  and the logarithms of quotients  $q_i$ .
